e-withdrawing and steric less hindered ligand!

Laurel L. Schafer *Org. Lett.*, **2013**, 15, 6002

- Ta–Cl bond [2.4959(8) Å] is significantly longer than Ta–NMe₂(axial) bond [1.970(3) Å]
- the bonding the of Ta–N amido bond lengths are shorter in 1 than in 2

Improved metal accessibility

increased electrophilic nature of the metal center

“The predominance of multiply deuterated products, especially from the Zr catalyst, suggests that further metalation of the intermediate metallacycle is fast compared with the reverse reaction.”

In contrast to reactions catalyzed by bis(anilide) **4**, little product was obtained when the mono(anilide) **5** was used instead (Table 2, entry 3). This result suggests that the key η^2 -imine intermediate **3** does not form as readily by elimination of HCl•amine (eq 3) as by elimination of amine.
