

# Cyclodehydrogenation of Arenes (Scholl Reaction)

By: Chris Johnson

4/17/2013

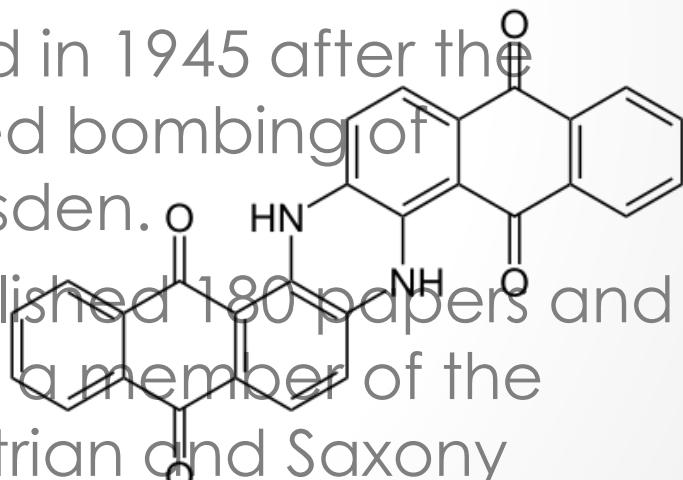

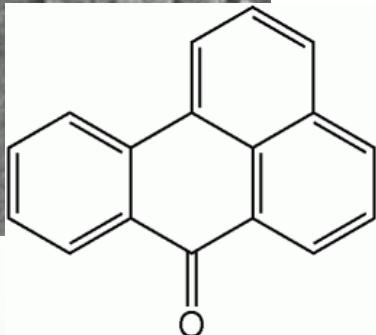

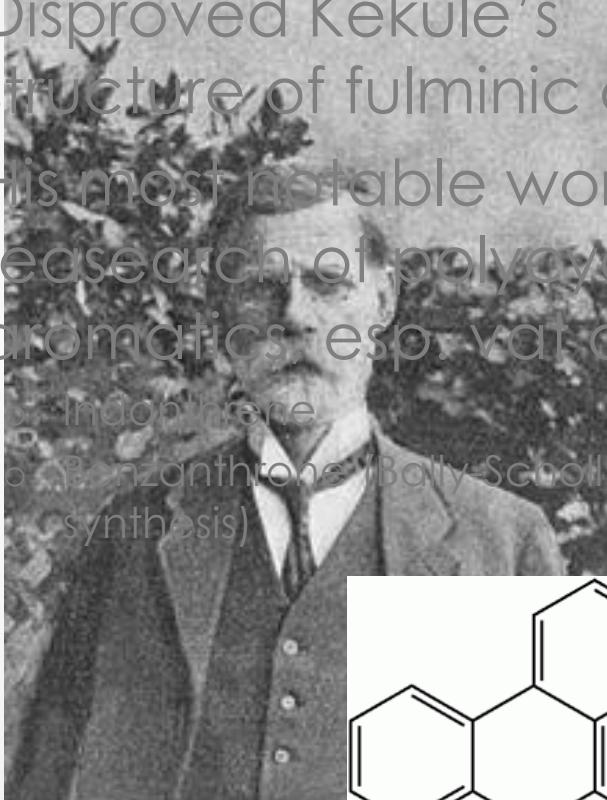

# Overview

- History
  - The Man
  - The Reaction
  - Related Variations
- Mechanism
  - Radical Cation or Arenium intermediates?
  - Controlling regioselectivity
- Applications
  - Interesting Examples
- Summary
- Questions???

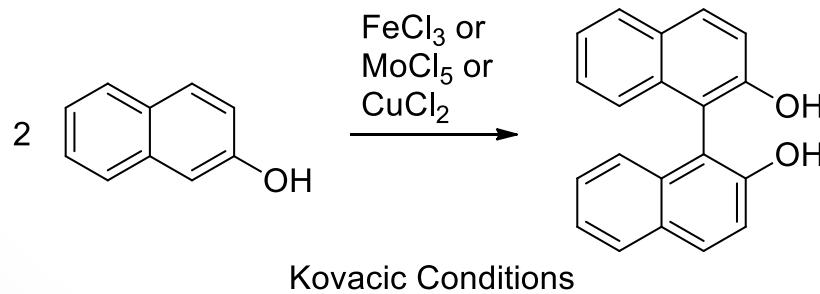

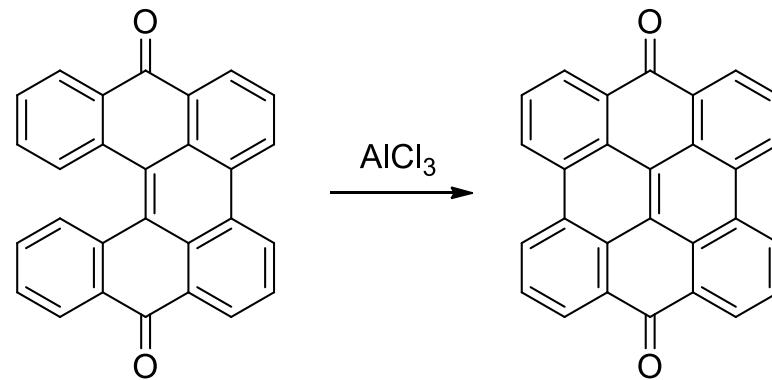

# Roland Heinrich Scholl

- Disproved Kekulé's structure of fulminic acid.
- His most notable work was research of polycyclic aromatics, esp. vat dyes.
  - Indophenol
  - Benzanthrone (Bally-Scholl synthesis)
- Born in Switzerland in 1865. His Career spanned 5 universities around Europe and 2 World Wars.
- Died in 1945 after the Allied bombing of Dresden.
- Published 180 papers and was a member of the Austrian and Saxony Academy of Sciences.

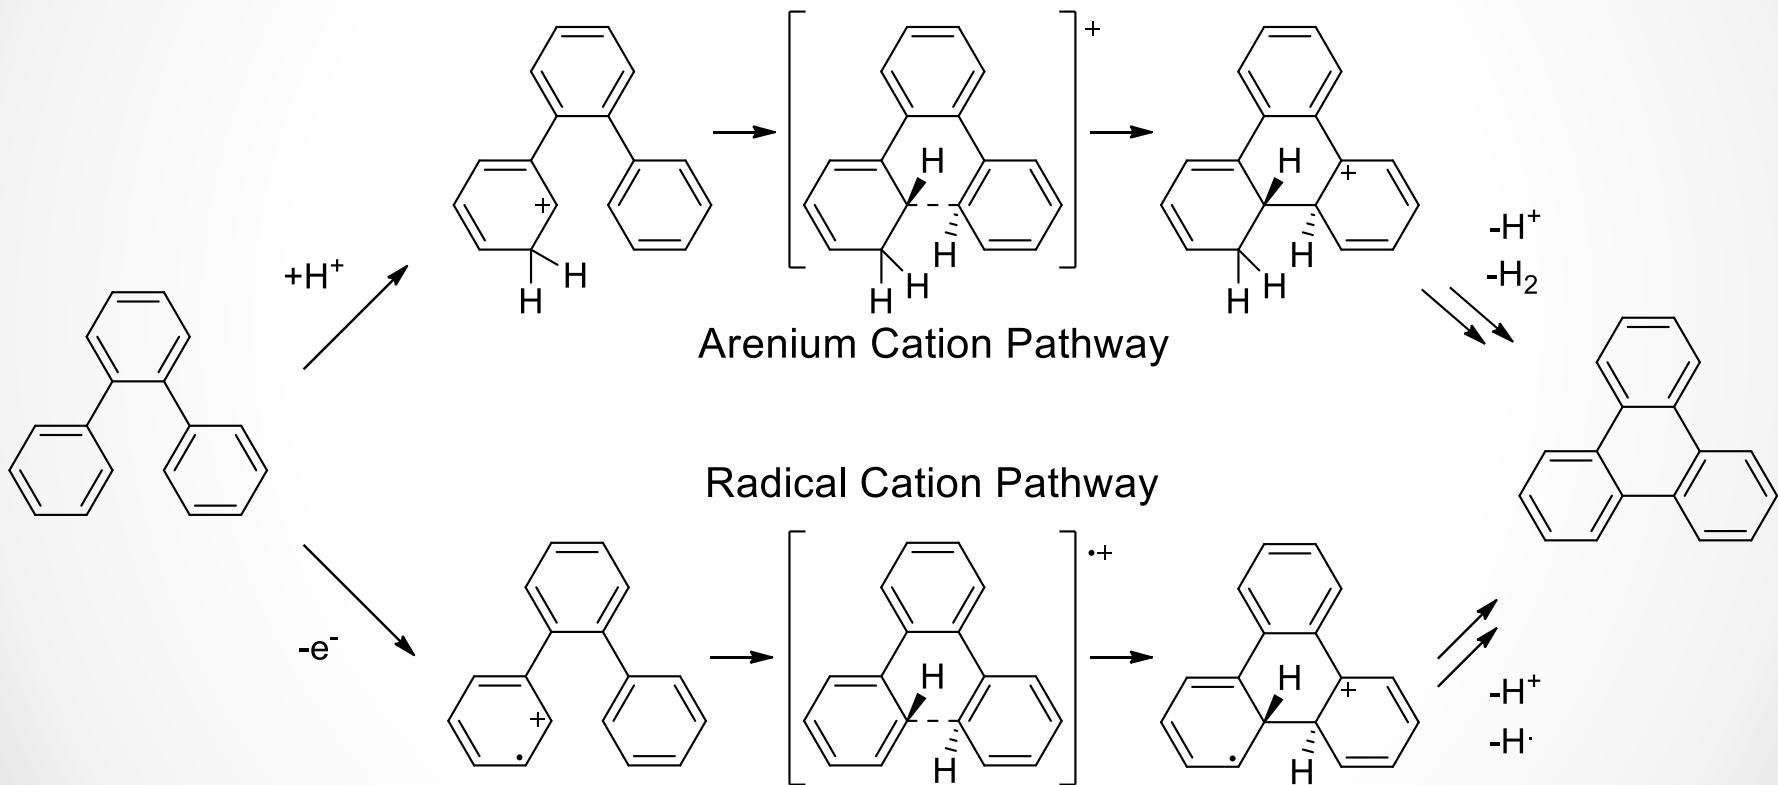

# Scholl Reaction

- Scholl, R.; Mansfeld, J. *Ber. Dtsch. Chem. Ges.* **1910**, 43, 1734-1746.
- Pummerer, R.; Prell, E.; Rieche, A. *Ber. Dtsch. Chem. Ges.* **1926**, 59, 2159-2161.

# Mechanism

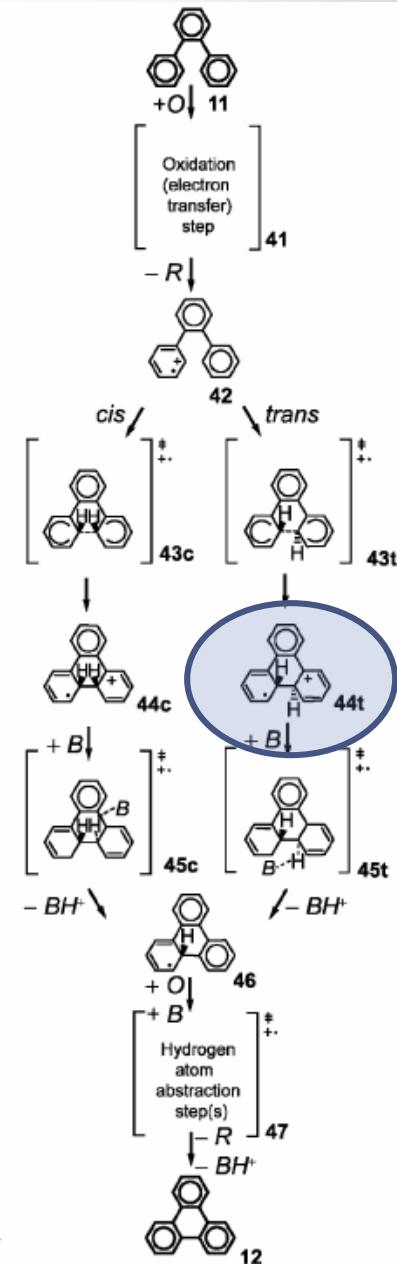

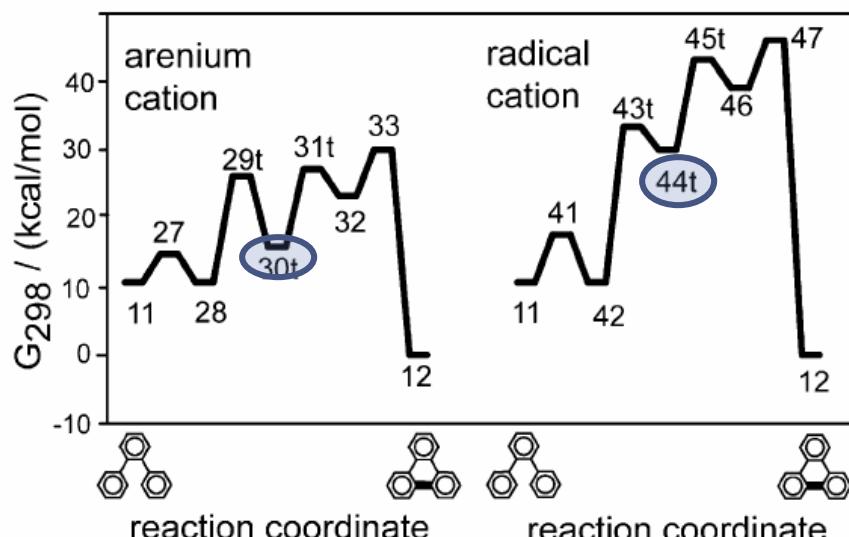

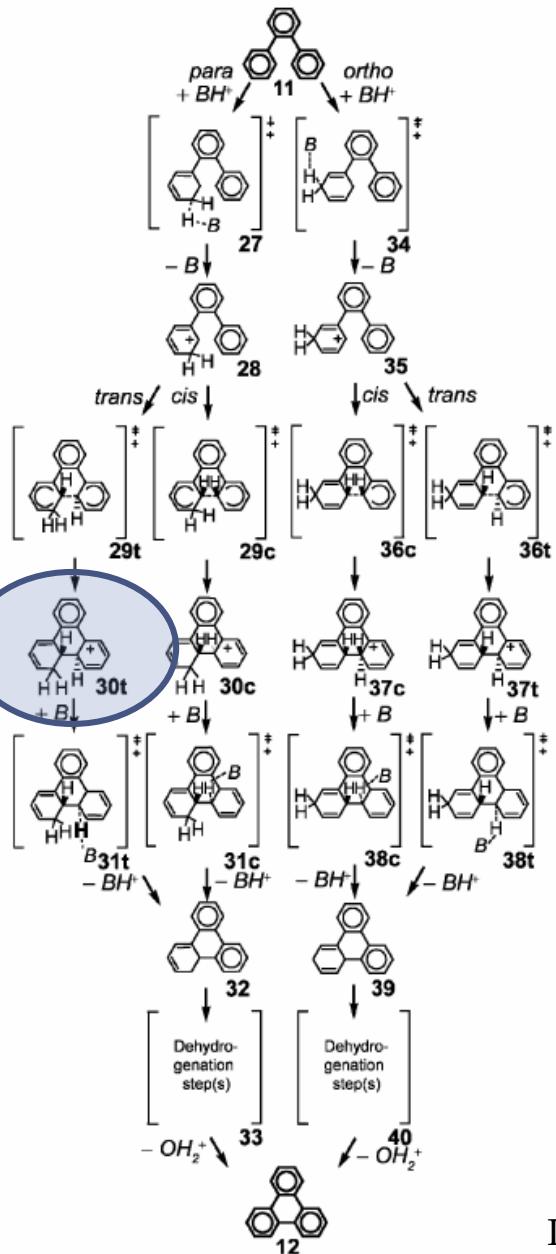

Rempala, P.; Kroulik, J.; King, B.T. *JACS* **2004**, 126, 15002-15003.

Rempala, P.; Kroulik, J.; King, B.T. *JOC* **2006**, 71, 5067-5081.

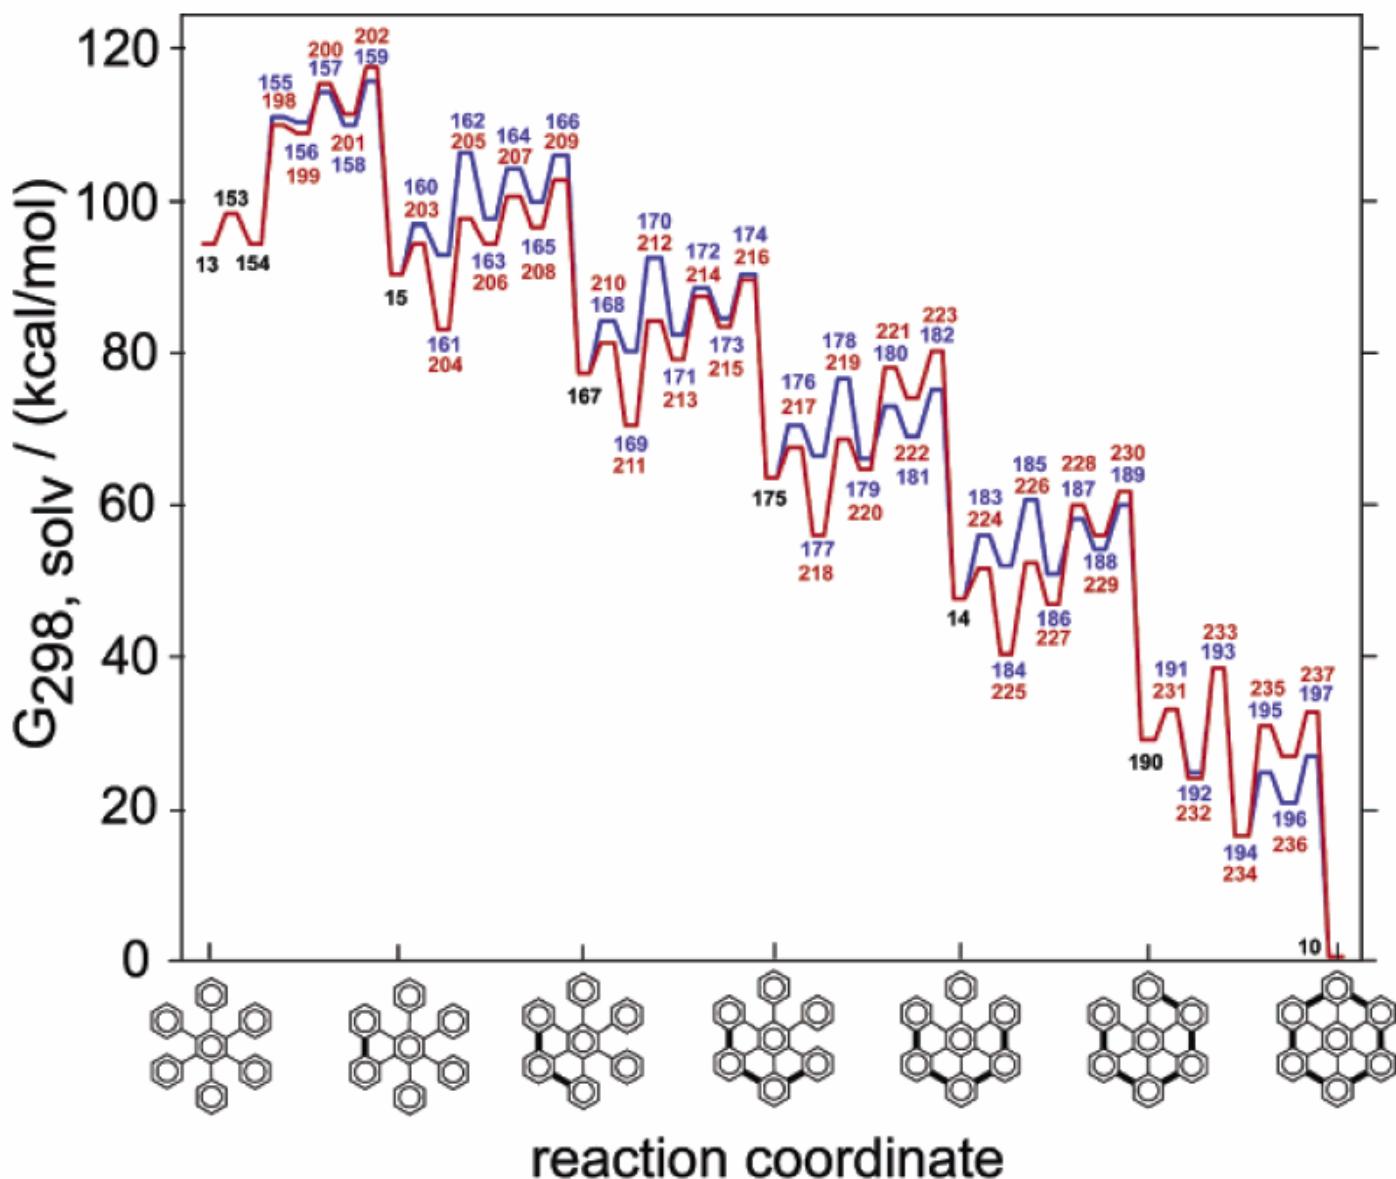

Zhai, L.; Shukla, R.; Wadumethrige, S.H.; Rathore, R. *JOC* **2010**, 75, 4748-4760.

# Arenium Cation Support

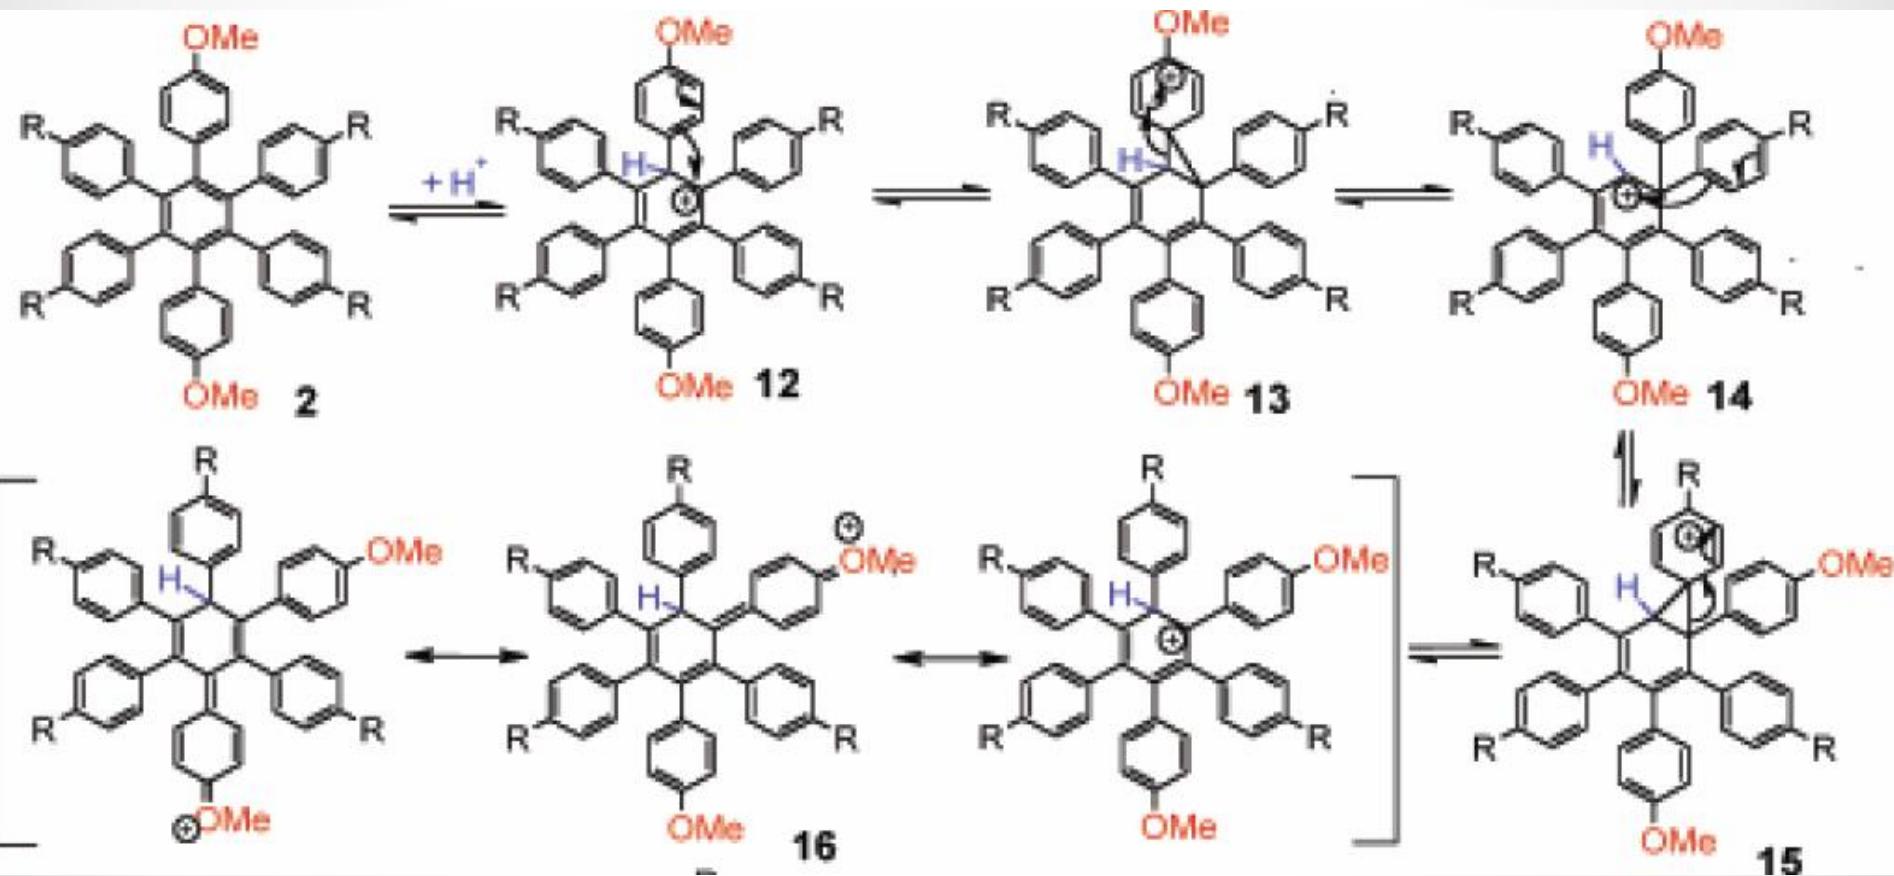

- DFT with Gaussian 03 and 98. B3LYP functional with standard 6-31G(d) basis set was used.
- $\text{CuCl}_2$  in  $\text{CS}_2$
- Transition states involving radical cations were higher in energy than with arenium cations

# Arenium Cation Calculations

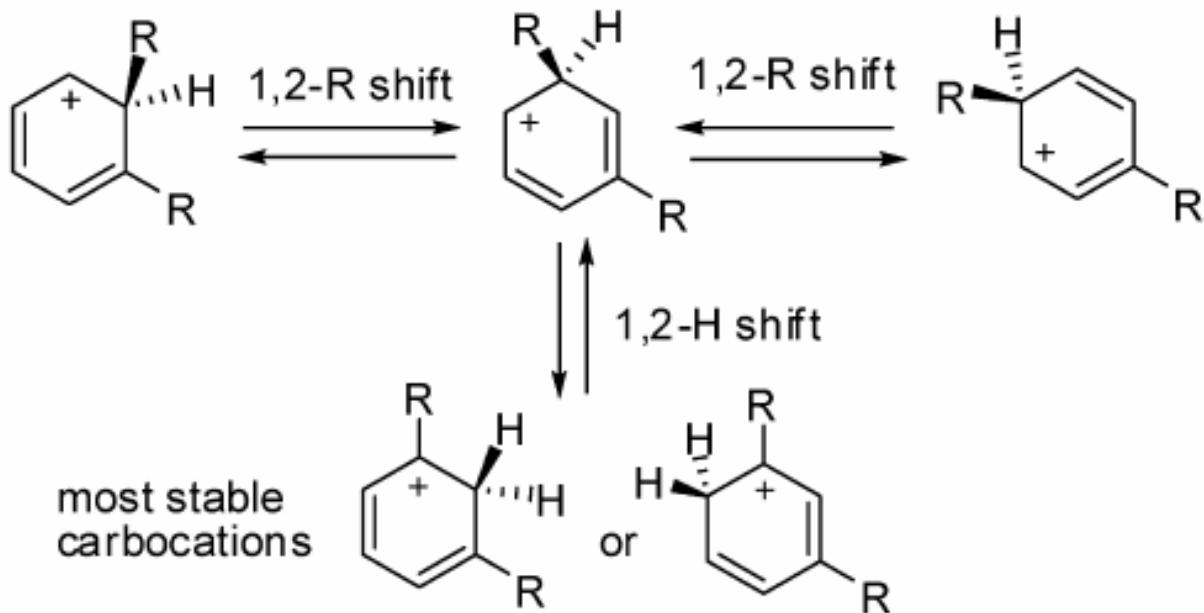

# Rearrangements

- Dou, X.; Yang, X.; Bodwell, G.J.; Wagner, M.; Enkelmann, V.; Mullen, K. *Org. Lett.* **2007**, *9*, 2485.

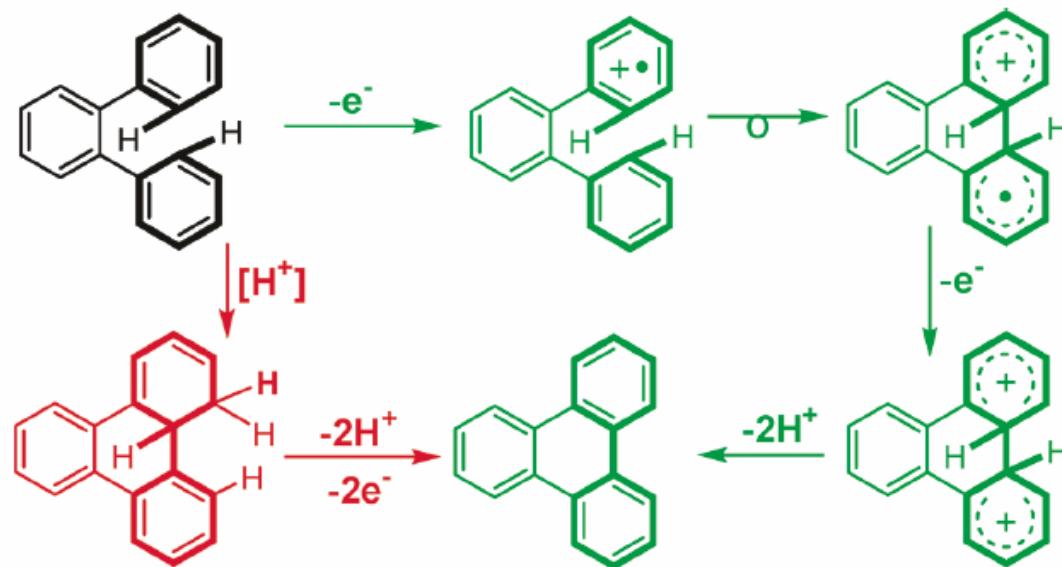

# Rearrangements

# Arenium Cation Conclusions

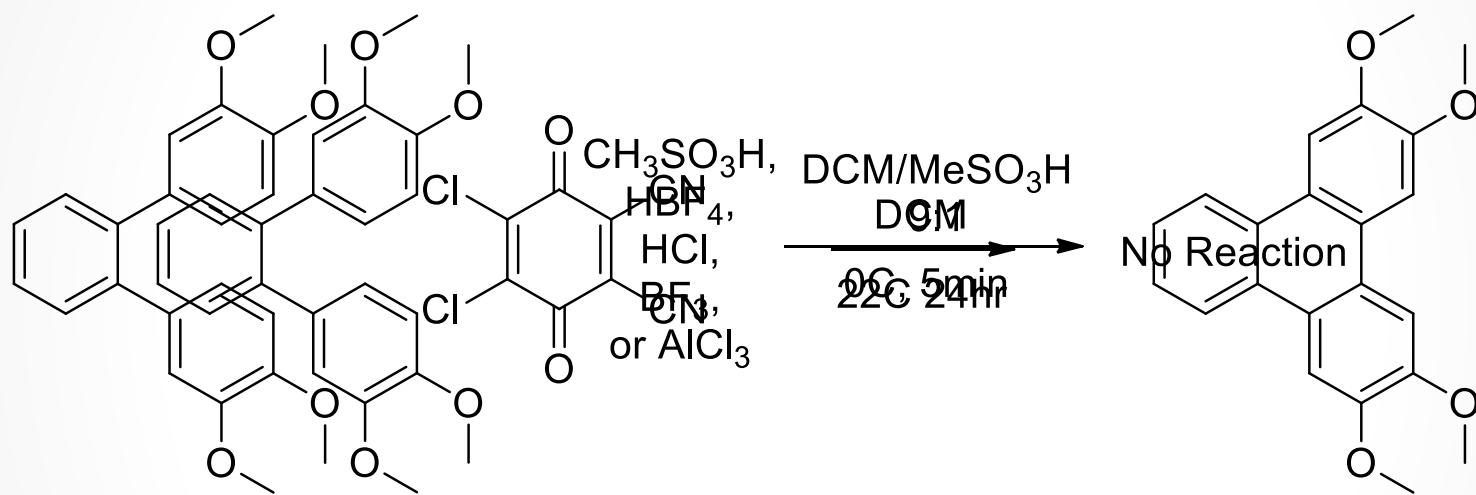

- The arenium cation mechanism involves lower energy transition states (according to DFT studies).
  - Observed rearrangement products support an arenium cation pathway.
  - Although these results suggest that intermediates won't accumulate; Mullen's group was able to isolate an intermediate
- 
-

# Radical Cation Support

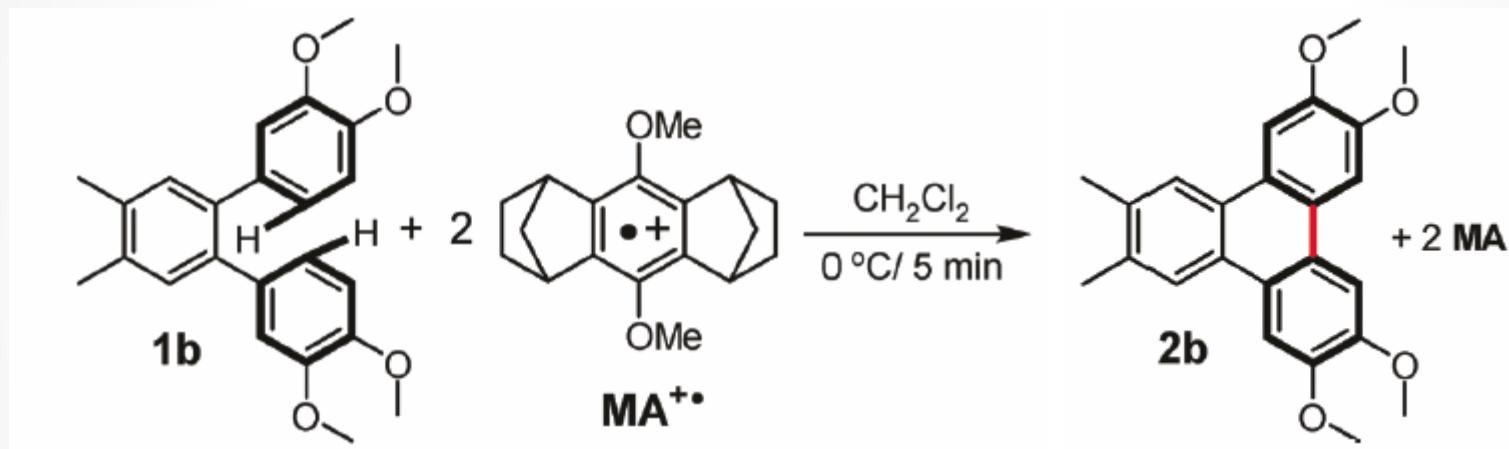

- Zhai, L.; Shukla, R.; Wadumethrige, S.H.; Rathore, R. *JOC* 2010, 75, 4748-4760.

# Role of Acid

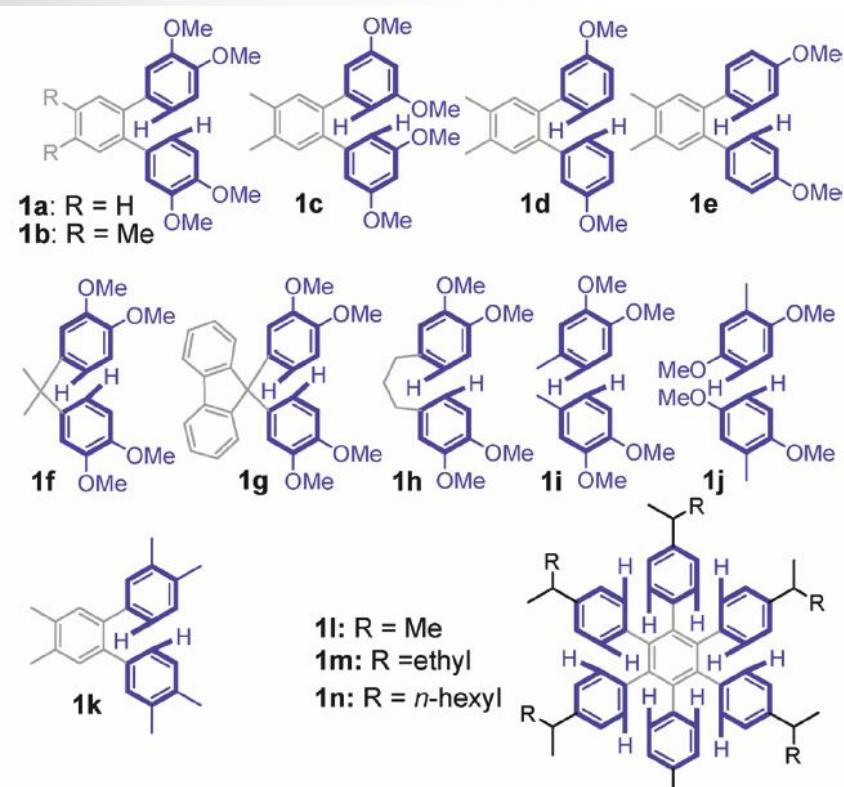

- No reaction of Scholl precursors in DCM/acid
- The same reactions worked when DDQ was added
- Zhai, L.; Shukla, R.; Wadumethrige, S.H.; Rathore, R. *JOC* 2010, 75, 4748-4760.

# Role of Acid

- Although acid is necessary with DDQ, it has been shown that other oxidants do not require any.
- Zhai, L.; Shukla, R.; Wadumethrige, S.H.; Rathore, R. *JOC* **2010**, 75, 4748-4760.

# Role of Oxidant

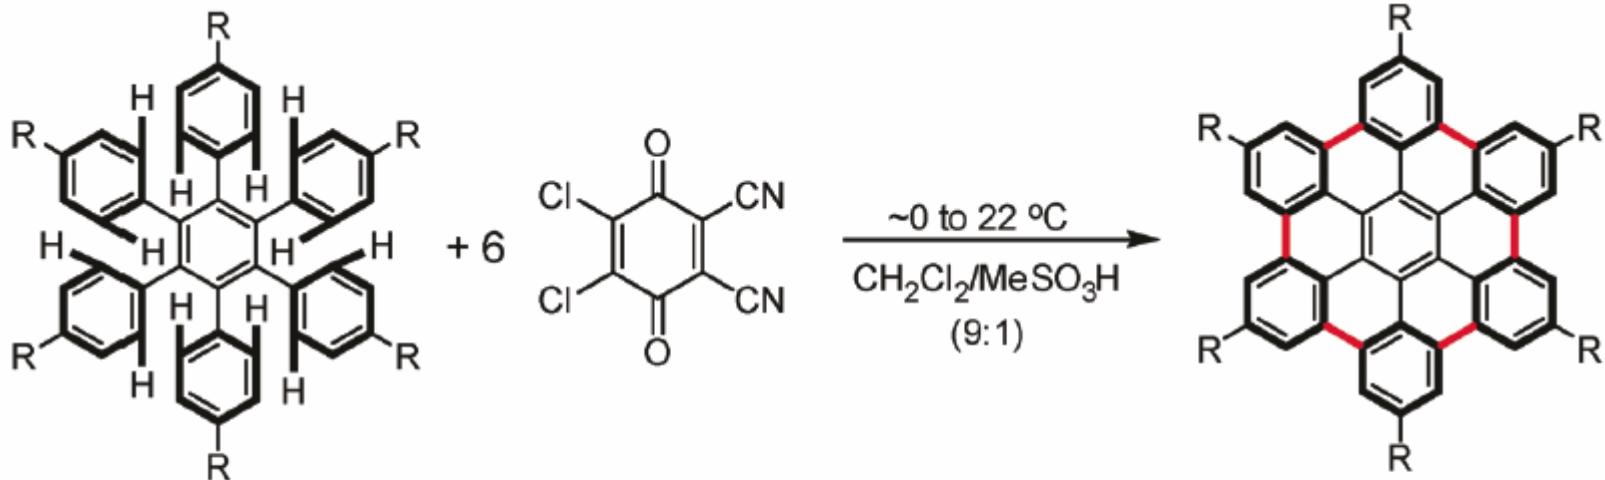

Scholl precursor	$E_{\text{ox(SP)}} \text{ V}$ vs SCE <sup>b</sup>	cyclized donor	$E_{\text{ox(CD)}} \text{ V}$ vs SCE <sup>c</sup>	$E_{\text{ox(SP)}} - E_{\text{ox(CD)}}$
<b>1a</b>	1.20	<b>2a</b>	1.15	0.05
<b>1b</b>	1.11	<b>2b</b>	1.08	0.03

<sup>a</sup>Experimental conditions: a 1.0 mM solution of the substrate and 0.1 M  $n\text{Bu}_4\text{NPF}_6$  (as the supporting electrolyte) in dichloromethane at a scan rate of 200 mV s<sup>-1</sup> and at 22 °C. <sup>b</sup>Irreversible cyclic voltammograms,  $E_{\text{ox(SP)}}$  were determined from square-wave voltammograms. <sup>c</sup>Reversible cyclic voltammograms.

O<sub>2</sub>)

- Oxidants strong enough to oxidize the parent arene are necessary for the Scholl oxidation
- Zhai, L.; Shukla, R.; Wadumethrige, S.H.; Rathore, R. *JOC* 2010, 75, 4748-4760.

# Role of Oxidant

**1o:** R = *tert*-butyl;  $E_{\text{ox}} \sim 1.6$  V SCE

**1p:** R = Br;  $E_{\text{ox}} > 2.1$  V SCE

**1q:** R = H;  $E_{\text{ox}} > 1.8$  V SCE

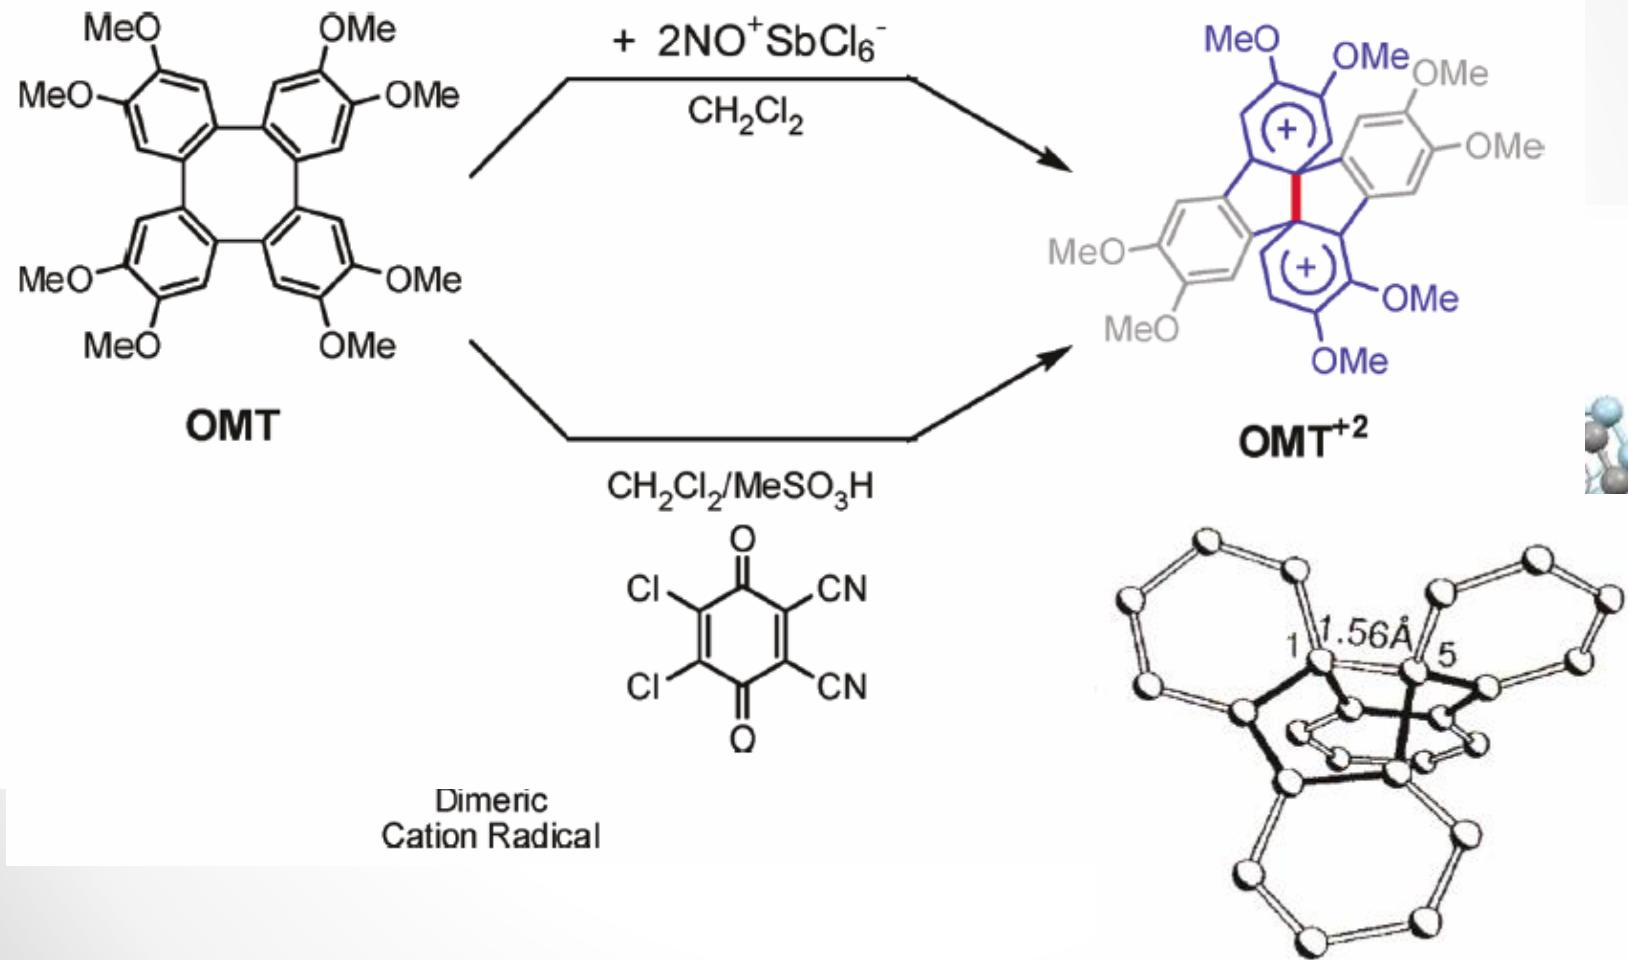

**2o:** R = *tert*-butyl (Y: ~99%/2h)

**2p:** R = Br (Y: 0%/72h)

**2q:** R = H (Y: 0%/72h)

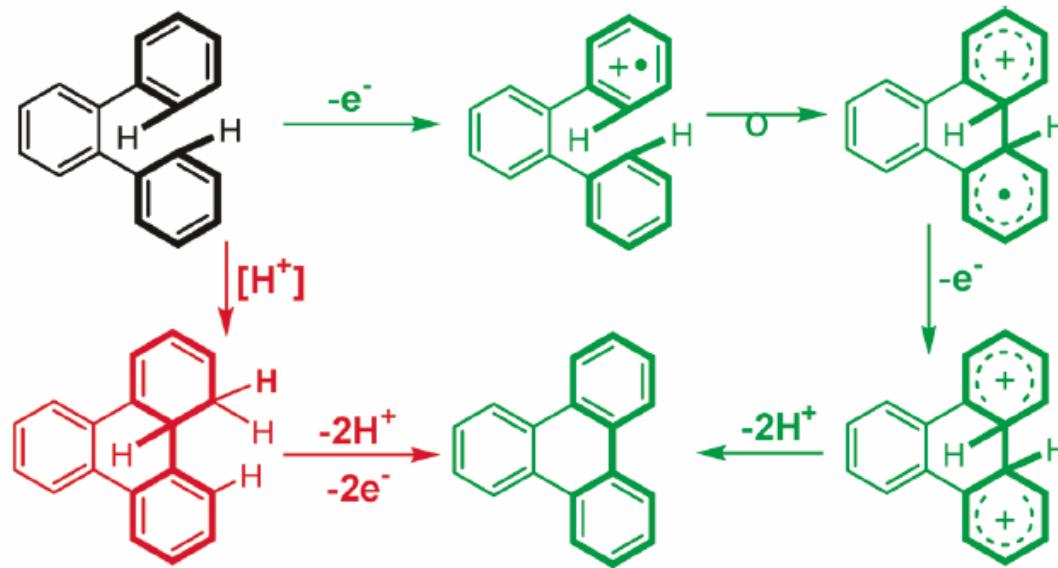

- Oxidants strong enough to oxidize the parent arene are necessary for the Scholl oxidation
- Zhai, L.; Shukla, R.; Wadumethrige, S.H.; Rathore, R. *JOC* 2010, 75, 4748-4760.

# Radical Cation Dimers

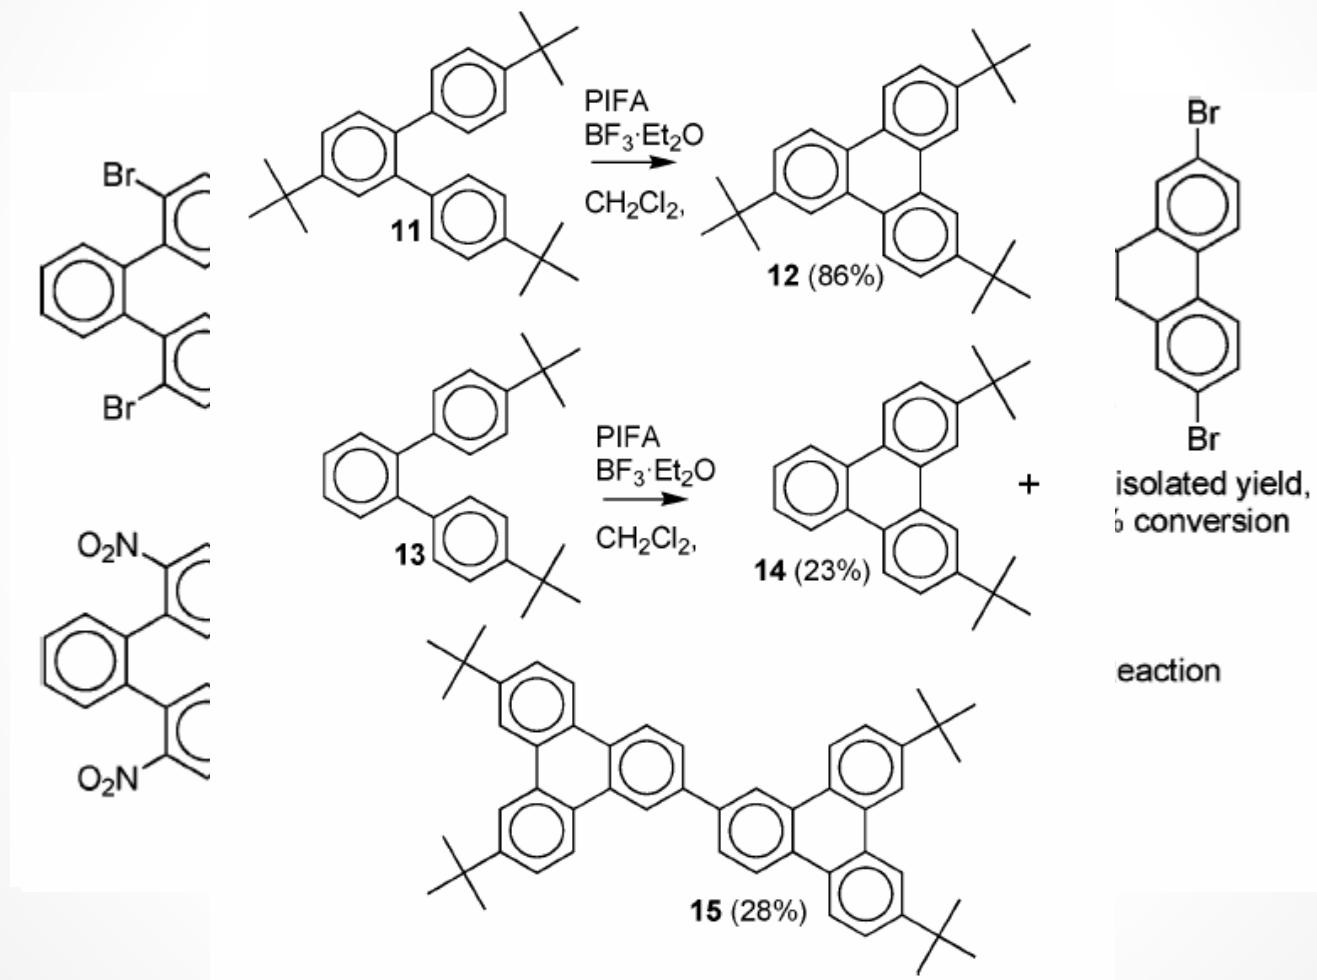

- Zhai, L.; Shukla, R.; Wadumethrige, S.H.; Rathore, R. *JOC* 2010, 75, 4748-4760.

# Radical Cation Summary

1. No reaction of Scholl precursors in DCM/acid
  2. Powerful oxidants are necessary
  3. Scholl precursors with oxidation potentials  $< 1.7V$  vs SCE react when using DDQ/ $H^+$
  4. Feasibility of the dicationic intermediate has been demonstrated
- Zhai, L.; Shukla, R.; Wadumethrige, S.H.; Rathore, R. *JOC* 2010, 75, 4748-4760.

# Controlling the Scholl Reaction

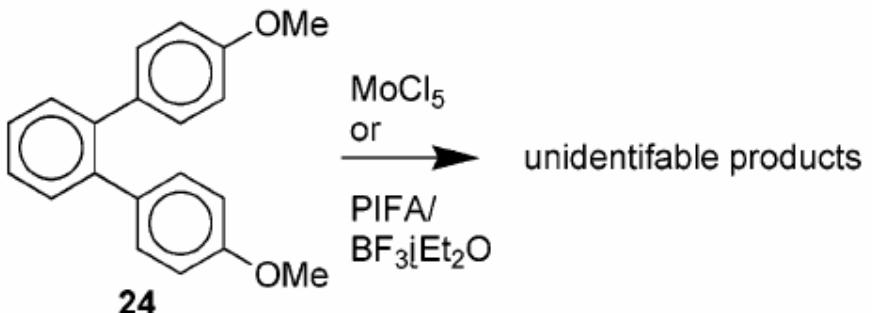

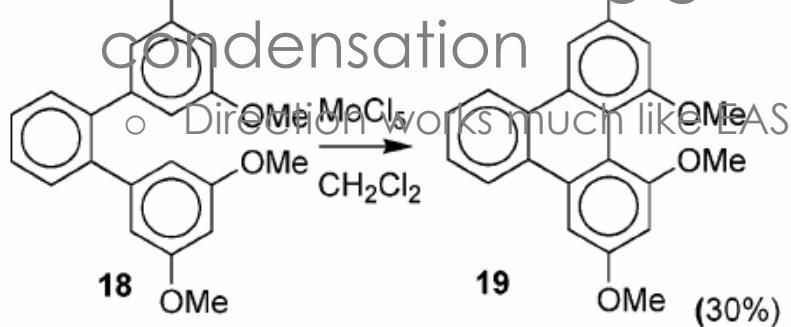

- King, B.T.; Kroulik, J.; Robertson, C.R.; Rempala, P.; Hilton, C.L.; Korinek, J. D.; Gortari, L.M. *JOC* 2007, 72, 2279-2288.

# Controlling the Scholl Reaction

Conclusions

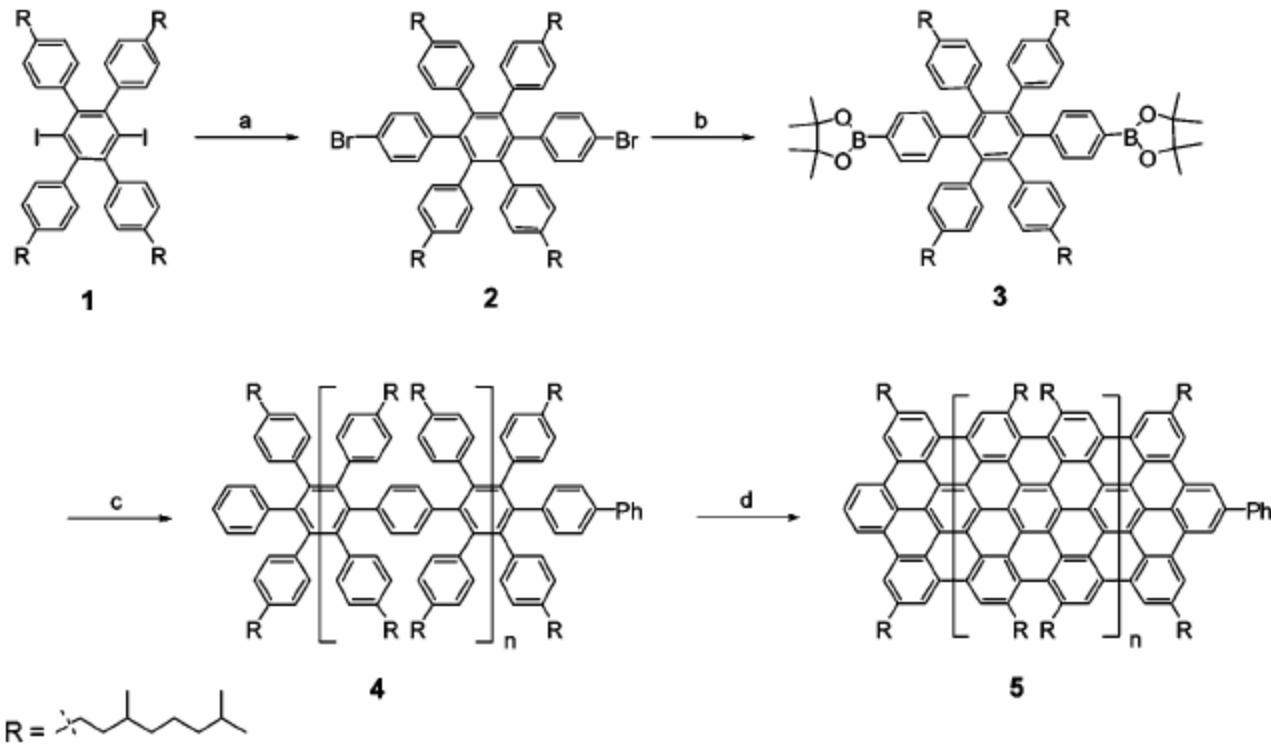

- Oligomerization can be groups.
- Electron directing group condensation

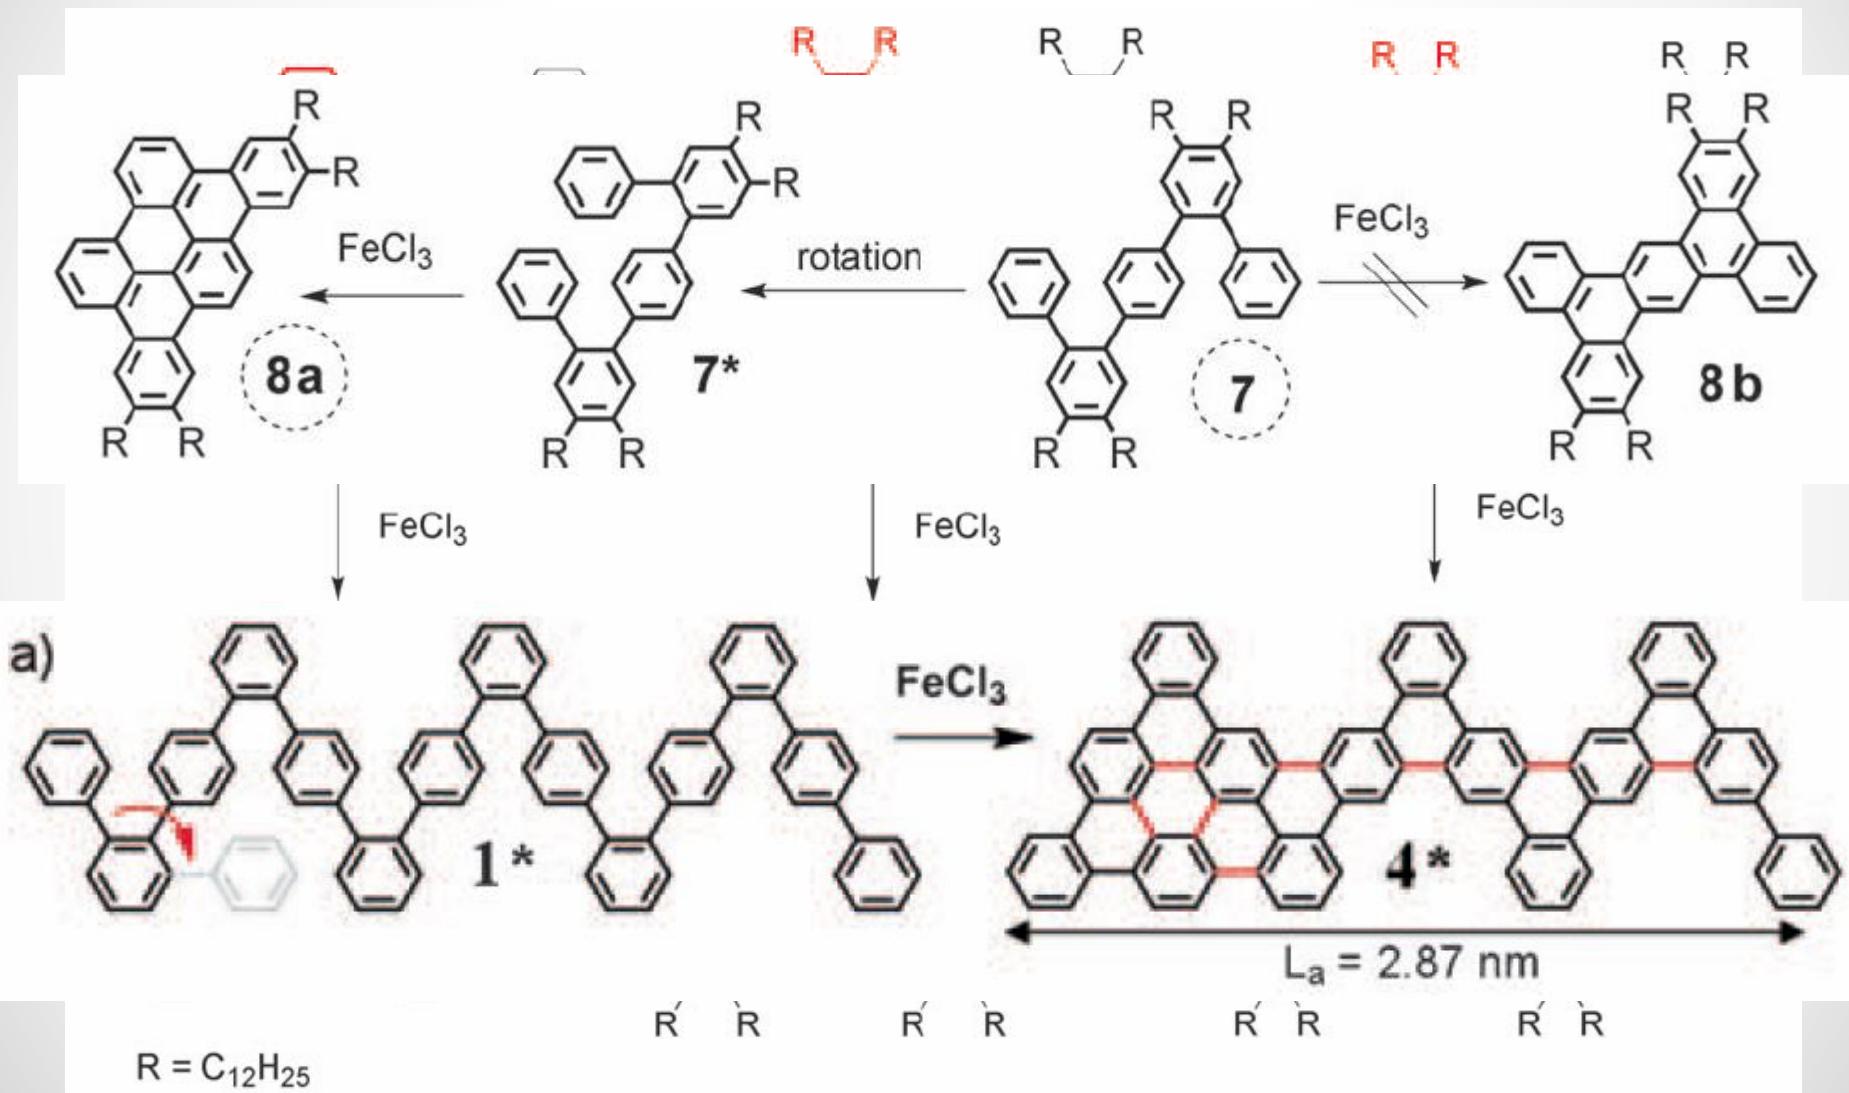

- King, B.T.; Kroulik, J.; Robertson, C.R.; Rempala, P.; Hilton, C.L.; Korinek, J. D.; Gortari, L.M. *JOC* 2007, 72, 2279-2288.

# Interesting Examples

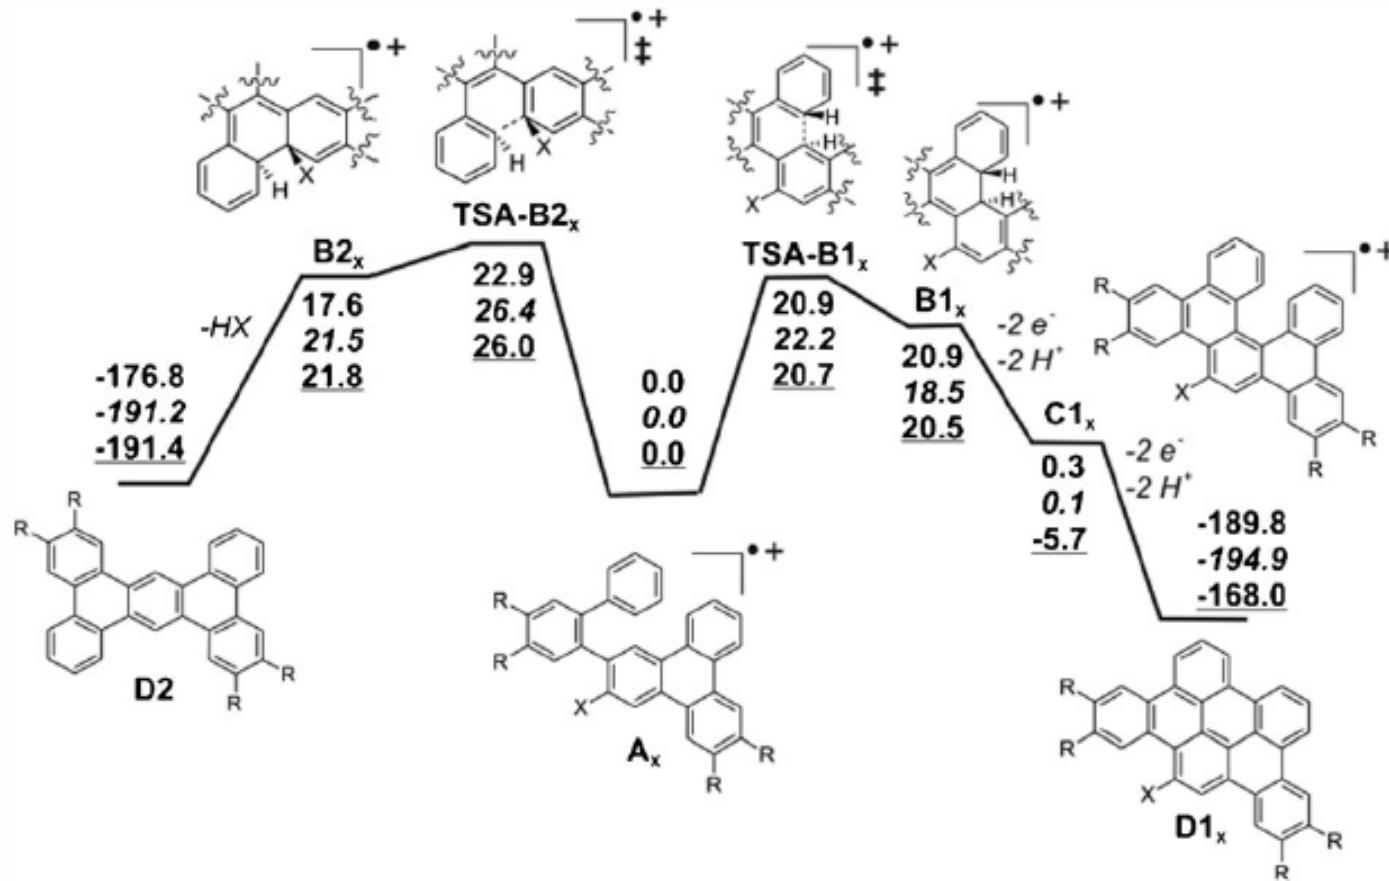

<sup>a</sup> Reagents and conditions: (a) 4-bromophenylboronic acid,  $\text{Pd}(\text{PPh}_3)_4$ , aliquat 336,  $\text{K}_2\text{CO}_3$ , toluene,  $80^\circ\text{C}$ , 24 h, 93%. (b) (i)  $n\text{-BuLi}$ , THF,  $-78^\circ\text{C}$ , 1 h; (ii) 2-isopropoxy-4,4,5,5-tetramethyl[1,3,2]dioxaborolane, rt, 2 h, 82%. (c) compound 1,  $\text{Pd}(\text{PPh}_3)_4$ , aliquat 336,  $\text{K}_2\text{CO}_3$ , toluene/ $\text{H}_2\text{O}$ , reflux, 72 h, 75%. (d)  $\text{FeCl}_3$ ,  $\text{CH}_2\text{Cl}_2/\text{CH}_3\text{NO}_2$ ,  $25^\circ\text{C}$ , 48 h, 65%.

# Interesting Examples

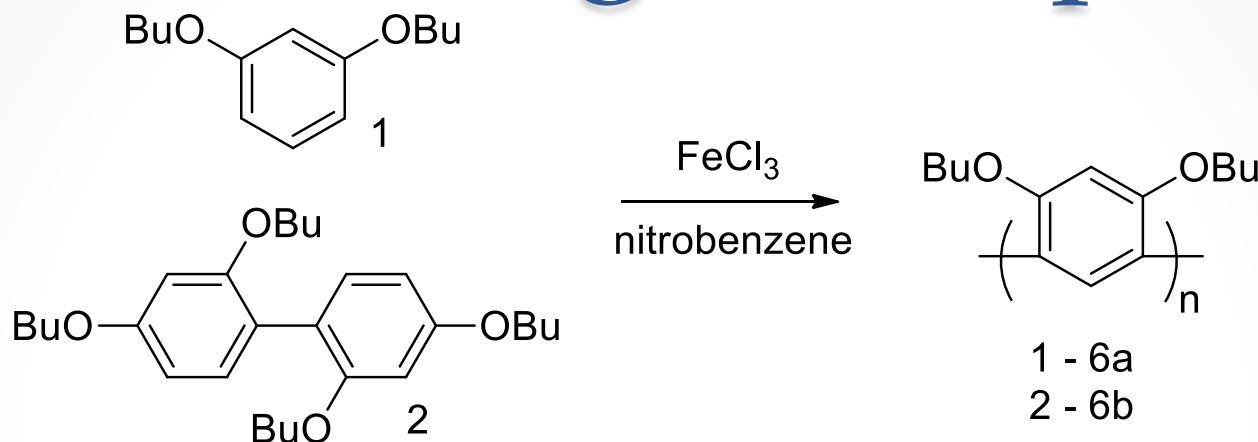

- Dossel, L.; Gherghel, L.; Feng, X.; Mullen, K. *Angew. Chem. Int. Ed.* **2011**, *50*, 2540-2543.

# Interesting Examples

**Fig. 1** Free energies  $\Delta G(\text{LC-}\omega\text{PBE/def2-SVP})$  for the selectivity-determining transition states relative to  $A_X$  ( $X = \text{H}, \text{F}, \text{OMe}$  (underlined values);  $R = \text{Me}$ ).

# Interesting Examples

Entry No.	Monomer	Polymer	FeCl <sub>3</sub> (Equiv.)	Yield (%)	M <sub>n</sub> <sup>b</sup>	M <sub>w</sub> /M <sub>n</sub> <sup>b</sup>
1	<b>1</b>	<b>6a</b>	2	41	4,000	1.4
2	<b>1</b>	<b>6a</b>	3	70	5,000	2.8
3	<b>1</b>	<b>6a</b>	4	77	12,000	2.8
4	<b>1</b>	<b>6a</b>	5	80	15,000	3.6
5	<b>3</b>	<b>6b</b>	2	85	11,000	1.8
6	<b>3</b>	<b>6b</b>	4	89	42,000	2.1

<sup>a</sup> Reaction condition: 1.0 mmol of monomer, Reaction time = 20 h, solvent = Nitrobenzene 2.0 mL (Entry No. 5 and 6 = 4.0 mL), room temperature, N<sub>2</sub> atmosphere.

<sup>b</sup> Measured by GPC on standard PSt.

# Interesting Examples

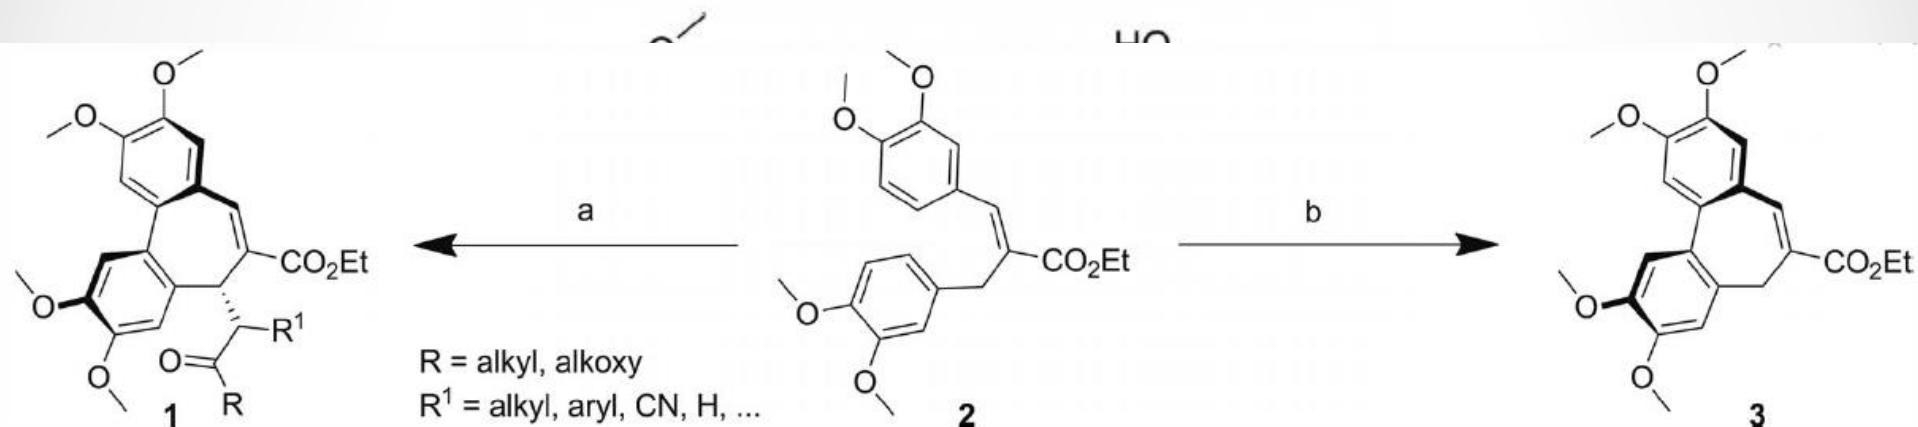

Figure 1. Oxidant-dependant reaction pathway: (a)  $\text{MoCl}_5$ ,  $\text{TiCl}_4$  then  $\text{R}^1\text{CH}_2\text{COR}$ ,  $\text{NEt}_3$ ; (b) PIFA,  $\text{BF}_3\cdot\text{OEt}_2$ .

**(aR,7S)-allocolchicine**

**metasequirin-B**

- Hackeloer, K.; Schnakenburg, G.; Waldvogel, S.R. *Eur. J. Org. Chem.* **2011**, 6314-6319.

# Summary

- Long history, since 1910, but most applications have been during the last decade.
- The mechanism is controversial
  - Radical Cation Vs. Arenium Cation
  - Support for both
  - Rearrangement is possible for intermediates
- Scholl reactions have been used in polymerizations, synthesis of graphene nanoribbons, and the formation of a natural product core structure

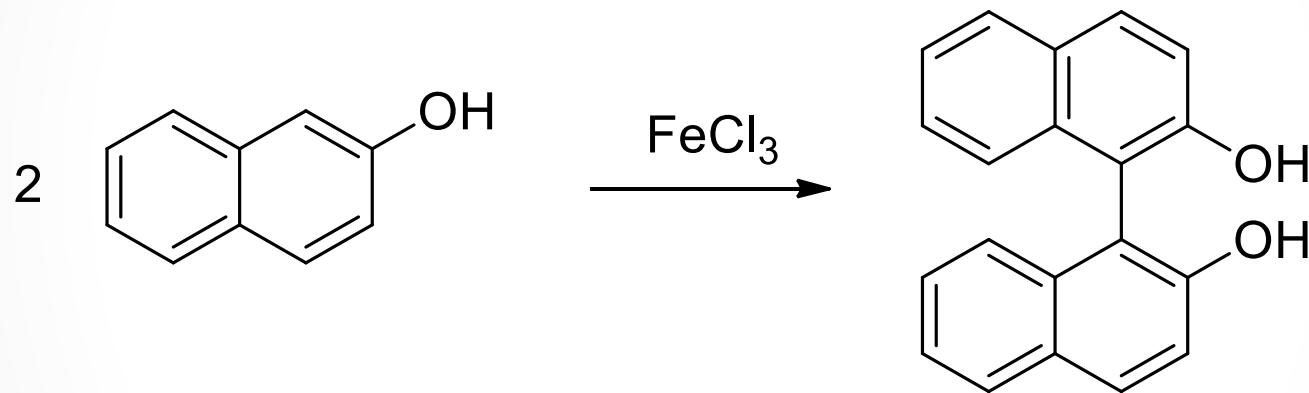

# THANKS!!!

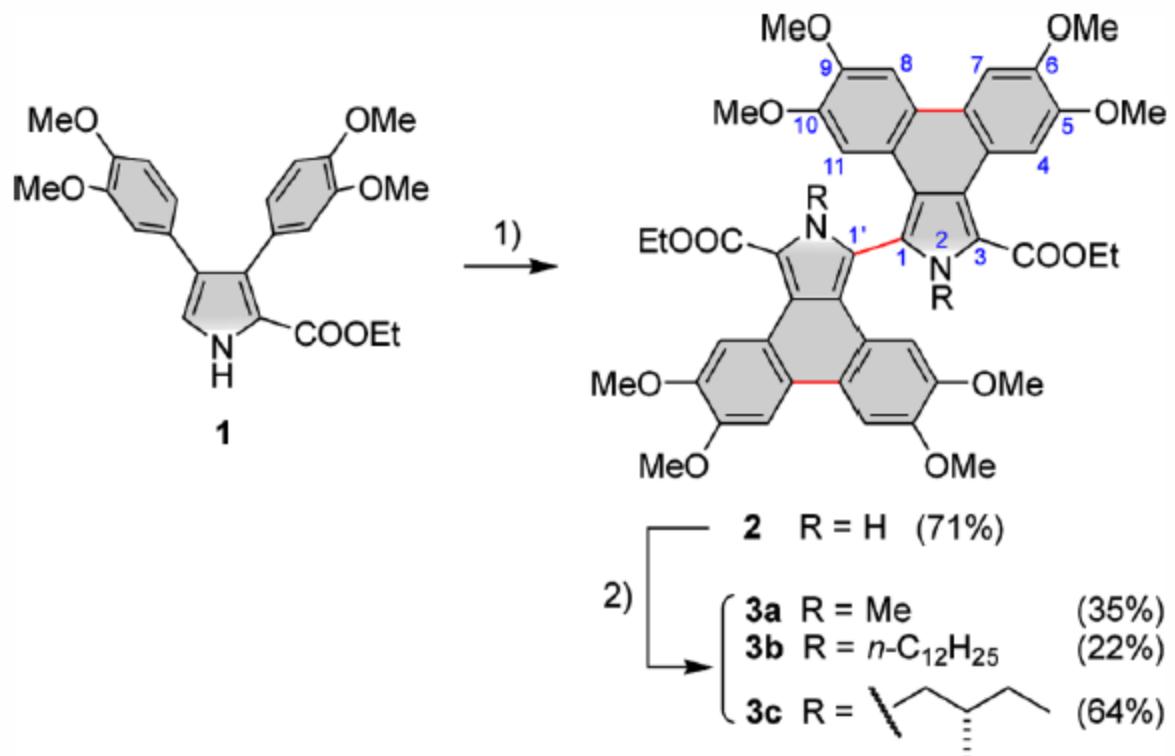

# Question Time

# Volunteers???

# Question 1

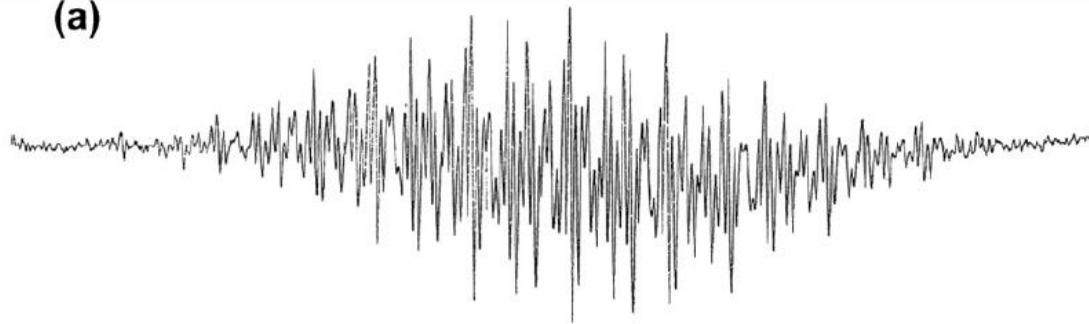

# Question 2

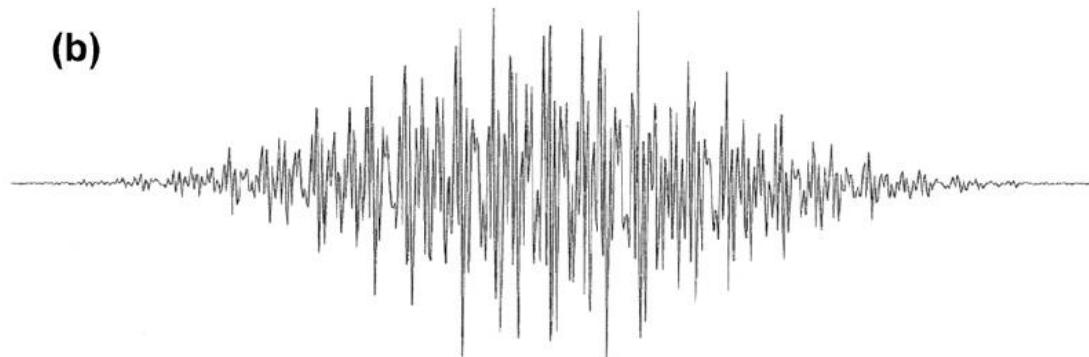

<sup>a</sup>Reagents and conditions: (1)  $\text{FeCl}_3$  (4 equiv),  $\text{CH}_2\text{Cl}_2$ , 22 h, 71%;  
(2)  $\text{RBr}$  (**3b**) or  $\text{RI}$  (**3a**, **3c**),  $\text{K}_2\text{CO}_3$ , 18-crown-6, 22–63%.

# Question 3

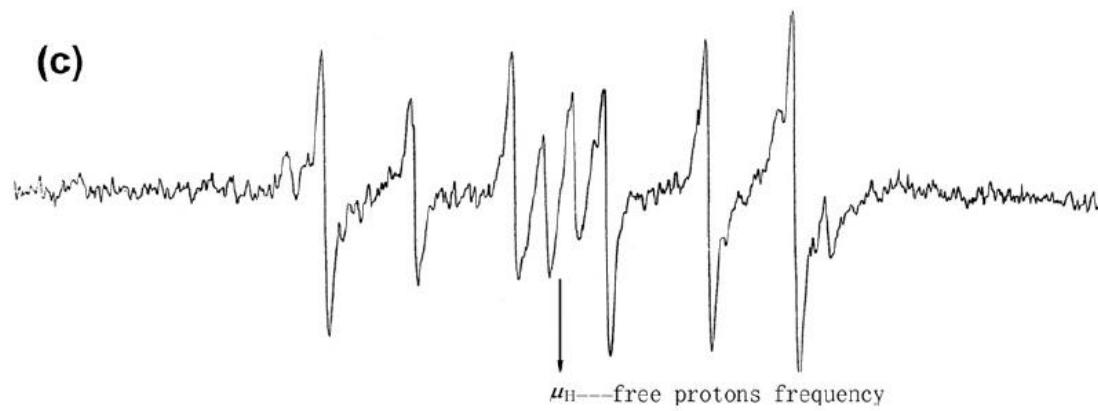

(a)

(b)

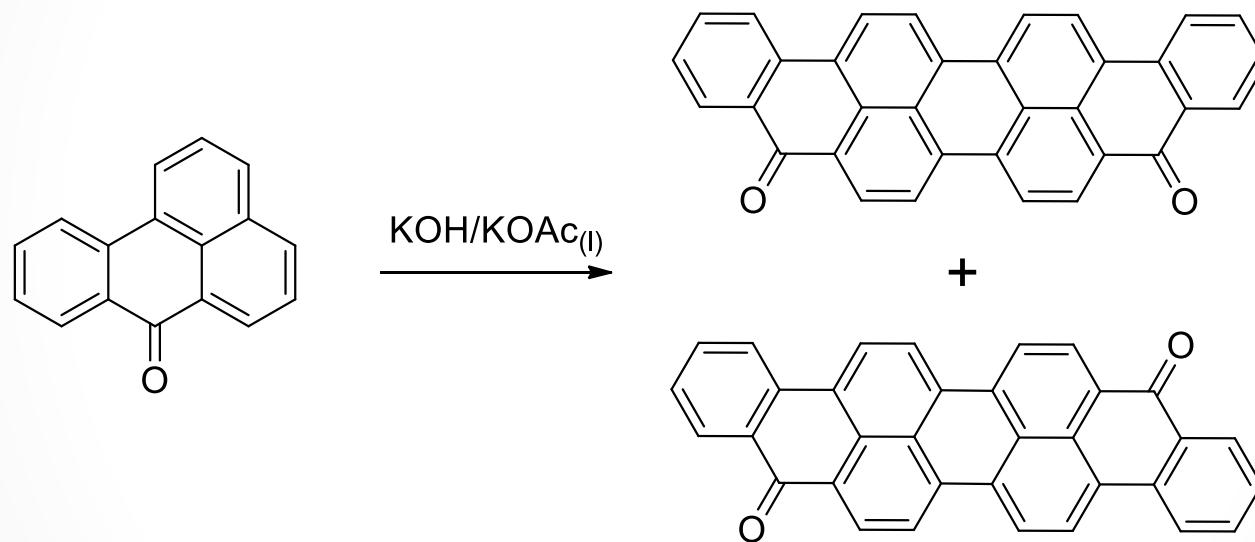

(c)

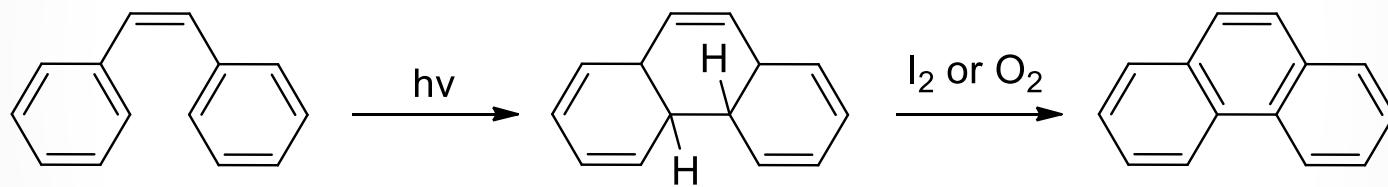

g. 1. (a) Experimental EPR spectrum of R1<sup>•</sup>. (b) Simulated spectrum, using the EXP parameters reported in Table 3. (c) Experimental ENDOR spectrum of R1<sup>•</sup>.
